

MAYNE

Fairfield 24in Square Planter | Model #5890

MIS150 - Fairfield 24x24 Square Planter Guide

FEATURES

UV Resistant

All Season Use

Self-Watering

Double Wall Design

PACKAGE CONTENTS: 1 x Fairfield Square Planter

MATERIAL: Polyethylene

WARRANTY: 15-year limited residential warranty, 5-year limited commercial warranty

IMPORTANT NOTE:

- Drainage holes are not pre-drilled allowing the planters to be used indoors. For outdoor use drainage holes need to be drilled. See instructions on the reverse side for more details.
- Mayne planters are very durable but we still recommend lightweight fillers and potting mixes for optimal plant growth.

DIMENSIONS & CAPACITY

Outer Dimensions

24in L x 24in W x 24in H

Inner Dimensions

19in L x 16in W x 16in H

Planter Capacity

Soil Capacity - 19.5 Gal
Water Reservoir - 9.5 Gal

General Planting Recommendations:

To maximize the efficiency of the sub-irrigation system we recommend the following steps:

- 1) Pour water directly into the planter to fill the reservoir. Allow the excess water to pour out the overflow hole on the side of the planter.
- 2) Next, add a few inches of lightweight filler to the bottom of the planter. This is optional but adding the lightweight filler will offer 3 benefits: it reduces the amount of potting mix required, it encourages faster root growth down into the troughs, and it will help decrease the overall weight of the planter making it easier to move around. Some suggestions for lightweight fillers include lava rock, mulch, wood chips, or foam packing peanuts (don't use foam packing peanuts if you are growing edible plants).
- 3) Fill the planter with a potting mix to within a few inches of the top. Regular garden soil is not recommended since it compacts too easy and doesn't allow for proper aeration or drainage.
- 4) Start planting and enjoy!

Sub-Irrigation System

The Fairfield patio planters are molded with a double wall design that creates a trough system and sub-irrigation water reservoir at the bottom of the planter. As noted in the steps above, the water reservoir can be filled prior to planting. Alternatively, the planter can be filled with potting mix first and then with regular watering the reservoir will naturally fill up. Once the reservoir is full, capillary action allows water to soak upward keeping the soil and plant roots moist. To avoid oversaturation an overflow hole is drilled in the side of the planter allowing excess water to drain out. Regular watering is required for the first few weeks giving the root system time to develop. Once the roots have grown down into the troughs the plants will be able to pull moisture from the reservoir creating a self watering effect. With this system you will find the potting mix stays moist longer than traditional container planters. Please note that even with the reservoir and self watering effect, occasional watering is still needed.

Plug Installation:

Mayne planters are molded with a double wall design that creates an internal water reservoir. To provide direct access to the reservoir we recommend drilling a 3/4 inch hole on the top or back side of the planter. To cover the hole we have included a rubber plug that can be easily removed to fill or drain the planter as needed.

OPTION #1
Drill 3/4in hole on the
top rim of the planter

OPTION #2
Drill 3/4in hole on the
back of the planter

Note: The rubber plug is provided as an added feature so drilling the drainage hole is completely optional. Not intended for use on the bottom of the planter as the plug may not create a water tight seal.
